

ANTISTATIC BRUSH SAL-08

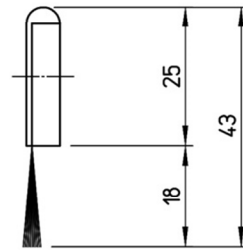

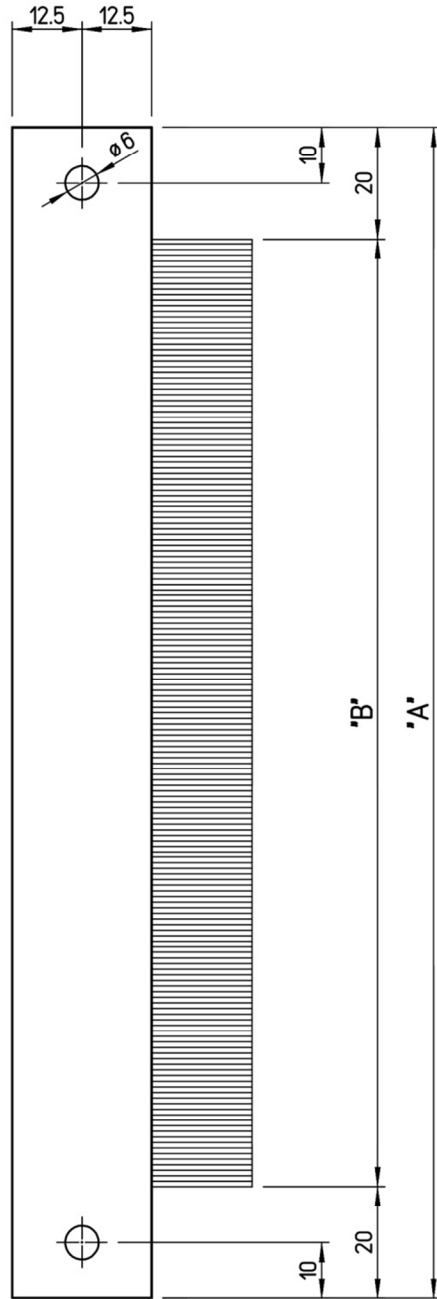

Our antistatic brush SAL-08 in carbon fibres can rid out the electrostatic charges that are created on the surfaces during the manufacturing.

The brush bristles are really soft and thin so that the brush touches the material with the static charge without damaging it.

The antistatic brushes do not have to be against the material to discharge, but if the static charge is not high they can be mounted to a distance of 2-5 mm. Moreover, they do not need any supplier, but only grounding and easy instructions for the installation.

Our antistatic brushes can be realized in different length according to the customer requirements.
